

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

February 2011

The primary metals leading index continued to climb in January, increasing for the sixth consecutive month. Its 6-month smoothed growth rate, however, decreased slightly in January. The U.S. recovery is likely to support a modest metals demand. Moreover, sustained strong growth in China will further boost metals demand. The metals price leading index increased in December, and its growth rate continued to move closer to positive territory, suggesting price increases for metals in the near term.

The **primary metals leading index** increased 0.4% in January to 156.8 from a revised 156.2 in December. The index's 6-month smoothed growth rate, a compound annual rate that measures the near-term trend, however, slipped to 11.2% from a revised 11.7% in December. A growth rate above +1.0% is usually a sign of an upward near-term trend for future metals activity, while a growth rate below -1.0% indicates a downward trend. For an explanation of these indexes and a definition of the primary metals industry, see [page 10](#).

Three of the index's four available components increased in January. The Institute for Supply Management's PMI remains above the threshold that denotes an increase in future manufacturing activity. Moreover, the PMI rose to a 80-month high and contributed 0.5 percentage points to the net increase in the leading index. The stock price index combining construction and farm machinery companies and industrial machinery companies continued to rise in January, contributing 0.5 percentage points to the leading index. A jump in the USGS metals price index growth rate also contributed 0.5 percentage points. In contrast, a one-half hour shorter average workweek in primary metals establishments offset some of those gains by 1.1 percentage points. The primary metals leading index will likely be revised next month when the remaining four components become available.

The increasing primary metals leading index and its high growth rate suggest that the recovery in the primary metals industry should continue in the near future. The outlook for the U.S. manufacturing sector is positive enough to expect moderate domestic metals consumption. Furthermore, global economic growth, particularly from emerging and developing countries, appears strong enough to support metals demand in the near term.

The **steel leading index** increased 1.3% in December, the latest month for which it is available, to 113.5 from a revised 112.0 in November. Its 6-month smoothed growth rate moved up to 8.4% from a revised 6.6% in November. Six of its nine indicators posted gains in December. A longer average workweek in iron

and steel plants and an abnormally high index for new housing permits issued made the largest positive contributions to the leading index in December. The jump in building permits could be related to the rush for application approval before changes in building codes that became effective in January 2011. The S&P stock price index for steel companies also made a sizable contribution. In contrast, new orders for iron and steel products decreased in December, but still remained near a 2-year high. The steel leading index growth rate is well above the +1.0% threshold that indicates increases in U.S. steel industry activity. Activity growth will likely continue to be strong in the near term.

The **copper leading index** increased 1.9% in December to 122.3 from a revised 120.0 in November. Its 6-month smoothed growth rate moved into positive territory, rising to 2.3% from a revised -1.6% in November. The S&P stock price index for building products companies, new housing permits issued, and the copper price made the largest positive contributions to the leading index. These large gains were offset by a shorter average workweek in nonferrous metal products except aluminum plants. Although the average workweek in December was shorter than the two previous months, it was close to the average for 2010. The copper leading index growth rate and the high demand for copper suggest that the recovery in the U.S. copper industry is likely to continue in the near term.

Strong Metals Demand Pushes Prices Higher

The **metals price leading index** increased 0.4% to 107.1 in December, the latest month for which it is available, from a revised 106.7 in November, and its 6-month smoothed growth rate increased to -6.1% from a revised -8.3% in November. The widening yield spread between the U.S. 10-year Treasury Note and the federal funds rate contributed 0.5 percentage points to the net increase in the leading index. A lift in the growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products contributed 0.2 percentage points. The growth

rate of the Organization for Economic Cooperation and Development (OECD) Total Leading Index, which had declined every month since the beginning of the year, appears to be leveling off. Its contribution rounded to zero. In contrast, a decrease in the growth rate of the trade-weighted average exchange value of other major currencies against the U.S. dollar made the only negative contribution, -0.4 percentage points, to the leading index. The metals price leading index signals major changes in the growth rate of nonferrous metals prices an average of 8 months in advance.

The growth rate of the inflation-adjusted value of U.S. nonferrous metal products inventories, which is an indicator of supply,

increased slightly in December. Nevertheless, relatively low inventories, along with the increasing metals price leading index growth rate, suggest continued metals price growth. High metals demand from emerging and developing economies continues to push some metal prices to new record levels. However, unrest in the Middle East and North Africa may affect global economic growth.

The business cycle, inventories, and geopolitical instability are only three factors in metal price determination. Other factors that affect prices include changes in metals production, strategic stockpiling, foreign exchange rates, speculation, and production costs.

NA: Not available **r:** Revised

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Organization for Economic Cooperation and Development (OECD) Total Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 2.

PRIMARY METALS: LEADING AND COINCIDENT INDEXES, 1989-2011 1977=100

Shaded areas are business cycle recessions. Asterisks (*) signify peaks (the end of an expansion) and troughs (the end of a downturn) in the economic activity reflected by the indexes.

CHART 3.

PRIMARY METALS: LEADING AND COINCIDENT GROWTH RATES, 1989-2011 Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

CHART 6.
COPPER: LEADING AND COINCIDENT INDEXES, 1988-2010

CHART 7.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1988-2010

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹Business Cycle Indicators, A monthly report from The Conference Board (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next update for these indexes is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, March 18. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the National Minerals Information Center. The report is prepared by Gail James (703-648-4915; e-mail: gjames@usgs.gov) and Ken Beckman (703-648-4916; e-mail: kbeckman@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
